Started on	Friday, 24 May 2024, 9:09 AM
State	Finished
Completed on	Saturday, 25 May 2024, 2:14 PM
Time taken	1 day 5 hours
Marks	5.00/5.00
Grade	100.00 out of 100.00

```
Question 1
Correct
Mark 1.00 out of 1.00
```

The **DNA sequence** is composed of a series of nucleotides abbreviated as 'A', 'C', 'G', and 'T'.

• For example, "ACGAATTCCG" is a **DNA sequence**.

When studying **DNA**, it is useful to identify repeated sequences within the DNA.

Given a string s that represents a **DNA sequence**, return all the **10-letter-long** sequences (substrings) that occur more than once in a DNA molecule. You may return the answer in **any order**.

Example 1:

```
Input: s = "AAAAACCCCCCAAAAACCCCCCAAAAAGGGTTT"
Output: ["AAAAACCCCCC","CCCCCAAAAA"]
```

Example 2:

```
Input: s = "AAAAAAAAAAA"
Output: ["AAAAAAAAAA"]
```

For example:

Input	Result
AAAAACCCCCAAAAACCCCCCAAAAAGGGTTT	AAAAACCCCC
	CCCCCAAAAA

Answer: (penalty regime: 0 %)

```
1 • def Sequences(s):
 2 🔻
        if len(s) < 10:</pre>
 3
            return []
        count = \{\}
 4
 5
        result = []
        for i in range(len(s) - 9):
 6
 7
            sequence = s[i:i+10]
 8 •
            if sequence in count:
9
                 count[sequence] += 1
10
            else:
11
                 count[sequence] = 1
12 •
        for sequence, c in count.items():
13
            if c > 1:
14
                result.append(sequence)
15
        return result
16
    s = input()
17
    result = Sequences(s)
18
19
   for sequence in result:
20
        print(sequence)
21
```

	Input	Expected	Got	
~	AAAAACCCCCAAAAACCCCCCAAAAAGGGTTT	AAAAACCCCC CCCCCAAAAA	AAAAACCCCC CCCCCAAAAA	~
~	АААААААААА	АААААААА	АААААААА	~

Passed all tests! 🗸

Correct

Question **2**

Correct

Mark 1.00 out of 1.00

Coders here is a simple task for you, Given string str. Your task is to check whether it is a binary string or not by using python set.

Examples:

Input: str = "01010101010"

Output: Yes

Input: str = "REC101"

Output: No

For example:

Input	Result
01010101010	Yes
010101 10101	No

Answer: (penalty regime: 0 %)

	Input	Expected	Got	
~	01010101010	Yes	Yes	~
~	REC123	No	No	~
~	010101 10101	No	No	~

Passed all tests! 🗸

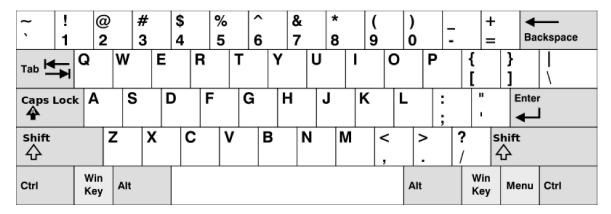

Correct

```
Question 3
Correct
Mark 1.00 out of 1.00
```

Given an array of <u>strings</u> words, return the words that can be typed using letters of the alphabet on only one row of American keyboard like the image below.

In the American keyboard:

- the first row consists of the characters "qwertyuiop",
- the second row consists of the characters "asdfghjkl", and
- the third row consists of the characters "zxcvbnm".

Example 1:

```
Input: words = ["Hello","Alaska","Dad","Peace"]
Output: ["Alaska","Dad"]
```

Example 2:

```
Input: words = ["omk"]
Output: []
```

Example 3:

```
Input: words = ["adsdf","sfd"]
Output: ["adsdf","sfd"]
```

For example:

Input	Result
4	Alaska
Hello	Dad
Alaska	
Dad	
Peace	
2	adsfd
adsfd	afd
afd	

Answer: (penalty regime: 0 %)

```
13
    result = []
14
15
16 → for word in words:
        lower_word = set(word.lower()) # Convert word to lowercase and create a set of characters
17
18 •
        if lower_word <= row1 or lower_word <= row2 or lower_word <= row3:</pre>
19
            result.append(word)
20 v if result != []:
        for i in range(0,int(len(result))):
21 🔻
            y="".join(result[i])
22
23
            print(y)
24 ▼ else:
25
        print("No words")
26
27
```

	Input	Expected	Got	
~	4 Hello Alaska Dad Peace	Alaska Dad	Alaska Dad	~
~	1 omk	No words	No words	~
~	2 adsfd afd	adsfd afd	adsfd afd	~

Passed all tests! 🗸

Correct

Marks for this submission: 1.00/1.00.

10

```
Question 4
Correct
Mark 1.00 out of 1.00
```

Given an array of integers nums containing n + 1 integers where each integer is in the range [1, n] inclusive. There is only **one repeated number** in nums, return this repeated number. Solve the problem using <u>set</u>.

Example 1:

```
Input: nums = [1,3,4,2,2]
Output: 2
```

Example 2:

```
Input: nums = [3,1,3,4,2]
```

Output: 3

For example:

Input	Result	
1 3 4 4 2	4	

Answer: (penalty regime: 0 %)

```
a=[]
 1
    b = input()
    a.append(b)
 3
 4 b = str(a)
   b.split()
c=[]
d = []
 5
 6
 7
 8 v for i in b:
9 •
        if i not in c:
10 •
             if chr(48)<i<chr(57):</pre>
11
                  c.append(i)
         elif i in c:
12 🔻
             if chr(48)<i<chr(57):</pre>
13 •
14
                 d.append(i)
print("".join(d))
```

	Input	Expected	Got	
~	1 3 4 4 2	4	4	~
~	1 2 2 3 4 5 6 7	2	2	~

Passed all tests! 🗸

Correct

```
Question 5
Correct
Mark 1.00 out of 1.00
```

Given a tuple and a positive integer k, the task is to find the count of distinct pairs in the tuple whose sum is equal to K.

Examples:

```
Input: t = (5, 6, 5, 7, 7, 8), K = 13

Output: 2

Explanation:

Pairs with sum K( = 13) are {(5, 8), (6, 7), (6, 7)}.

Therefore, distinct pairs with sum K( = 13) are { (5, 8), (6, 7) }.

Therefore, the required output is 2.
```

For example:

Input	Result
1,2,1,2,5	1
1,2	0

Answer: (penalty regime: 0 %)

```
n=input()
   k=int(input())
 2
   1st=()
4 v for i in str(n):
 5 •
        if i != ",":
 6
            lst+=(i,)
 7
    tup=lst
8
9
10
   seen = set()
11
    pairs = set()
12
13
    for number in tup:
        for j in range(1,len(tup)):
14
15
            if k== int(number)+ int(tup[j]):
16
17
                # Add the pair as a sorted tuple to ensure uniqueness
18
19
                seen.add(number)
                seen.add(tup[j])
20
21
22
   print(int(len(seen))//2)
23
```

	Input	Expected	Got	
~	5,6,5,7,7,8 13	2	2	~
~	1,2,1,2,5	1	1	~
~	1,2	0	0	~

Passed all tests! ✓
